Background

Sclerotinia (one of the most damaging diseases)

Sclerotinia head rot

Sclerotinia stalk & root rot (wilt)

Background

Cultivated sunflowers lack resistance genes to Sclerotinia, but **wild perennial *Helianthus* species** are highly resistant;

Phase 1:

12 sources were initiated for transferring stalk and head rot resistance genes in 2008-2013

- ❖ 2 hexaploids (*H. californicus* and *H. schweinitzii*)
- ❖ 3 diploids (*H. maximiliani*, *H. giganteus*, and *H. grosseserratus*)
- ❖ 2 diploids (*H. nuttallii* and *H. maximiliani*)
- ❖ 5 amphiploids (*H. nuttallii*/P21, *H. maximiliani*/P21, *H. gracilentus*/P21, *H. grosseserratus*/P21, and *H. strumosus*/P21)

Phase 2:

Six perennial *Helianthus* species were used in the interspecific cross in 2011-2012

- ❖ 2 tetraploids (*H. hirsutus*)
- ❖ 9 diploids (*H. salicifolius*, *H. occidentalis*, *H. silphioides*, *H. divaricatus*)
- ❖ 1 hexaploid (*H. resinosa*)

Phase 3:

Seven perennial *Helianthus* accessions 5 hexaploids (*H. strumosus*, *H. tuberosus*), 1 tetraploid (*H. decapetalus*), 1 diploid (*H. simulans*) were selected for resistance gene diversification.

Objective

- Transferring resistance genes from diverse wild species into cultivated backgrounds;
- Field evaluation to identify new materials with resistance genes to Sclerotinia;
- Confirming the outstanding families and preparing for germplasm release;
- Genetic study of Sclerotinia resistance and initiating QTL mapping populations.

Materials & Methods

- Seven wild perennial sunflower accessions were used:

$2n=6x=102$ ←

<i>H. strumosus</i> (PI547217)	×	HA410
<i>H. strumosus</i> (PI547226)	×	HA410
<i>H. tuberosus</i> (PI547242)	×	HA410
<i>H. tuberosus</i> (PI650089)	×	HA410
<i>H. tuberosus</i> (PI650105)	×	HA410
$2n=4x=68$ ←	<i>H. decapetalus</i> (PI435880) ×	
$2n=2x=34$ ←	HA410	
		<i>H. simulans</i> (PI664724) × HA410

- All immune to rust race 336;
- Mitotic chromosome counting and pollen fertility examination of the F_1 plants;
- Backcross with HA410.

Materials & Methods

Perennial hexaploid
 $(2n=6x=102)$

X HA410
 $(2n=2x=34)$

Embryo rescue

$F_1 \times HA410$
 $(2n=68)$

$BC_1 F_1$ seeds
 $(2n=51)$

Perennial tetraploid
 $(2n=4x=68)$

X HA410
 $(2n=2x=34)$

Embryo rescue

$F_1 \times HA410$
 $(2n=51)$

$BC_1 F_1$ seeds
 $(2n=?)$

Results

Flowering time of the wild perennial *Helianthus* species

Accessions	Flowering time (days)	Germination Date	Note
<i>H. strumosus</i> (PI547217)	212.5	2/1/2013	2n=102
<i>H. strumosus</i> (PI547226)	175	2/1/2013	2n=102
<i>H. tuberosus</i> (PI547242)	192	2/1/2013	2n=102
<i>H. tuberosus</i> (PI650089)	160.5	2/1/2013	2n=102
<i>H. tuberosus</i> (PI650105)	168	2/1/2013	2n=102
<i>H. decapetalus</i> (PI435880)	120.5	2/1/2013	2n=68
<i>H. simulans</i> (PI 664724)	270	3/1/2013	germinated, 2n=34
<i>H. simulans</i> (PI 664806)	/	2/1/2013	no germination
<i>H. simulans</i> (Ames 30807)	/	2/1/2013	no germination
<i>H. simulans</i> (PI435880) ?	/	2/1/2013	germinated, but 2n=68

Results

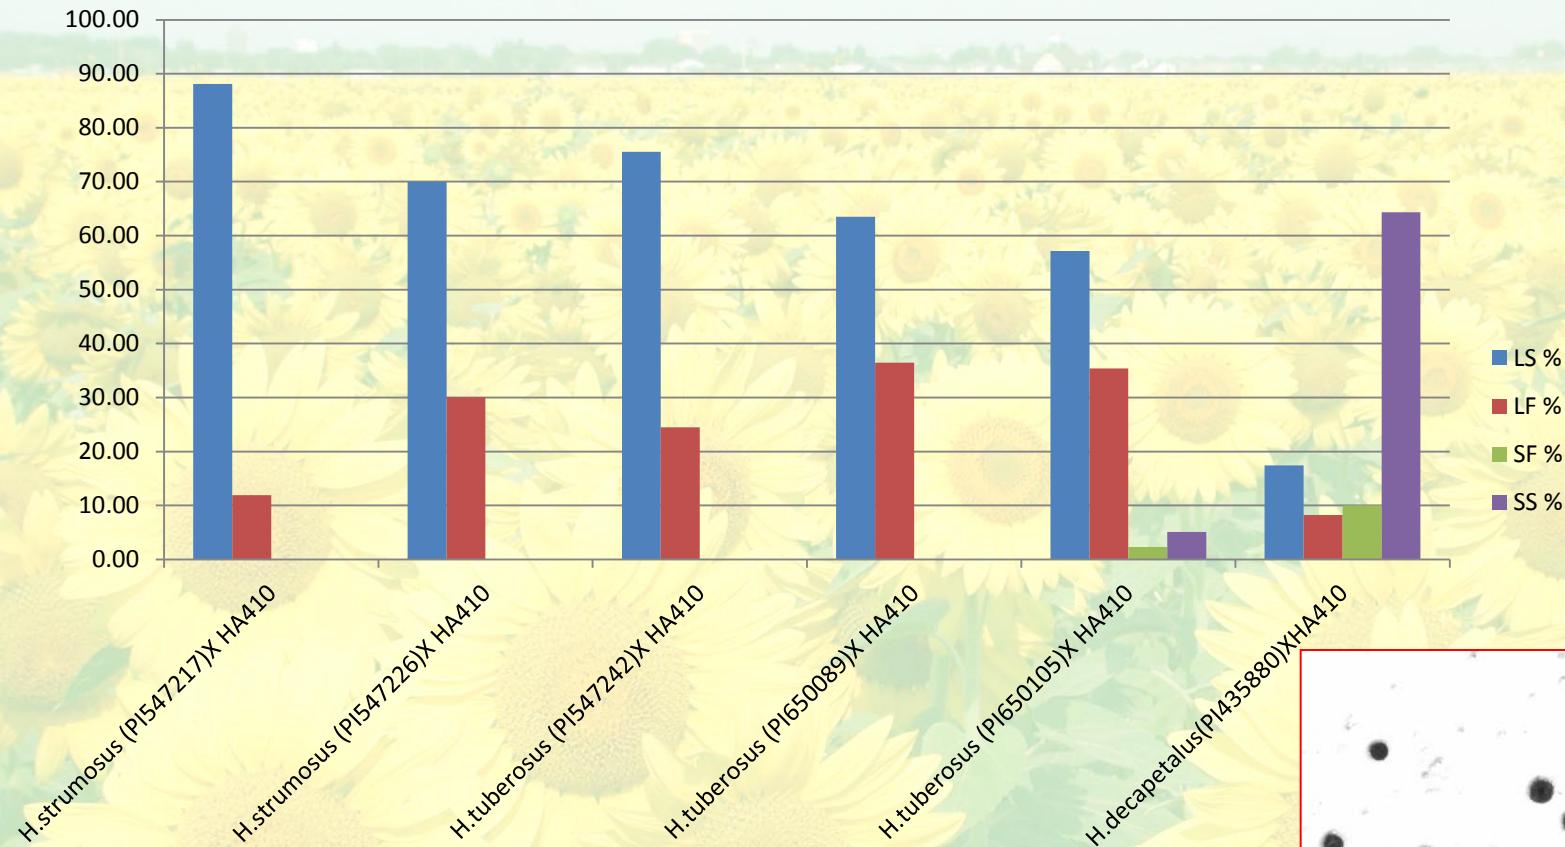

Embryo rescue data of 6 interspecific cross combinations

Parentage	# Embryo	#Gl.	#E.H.	#H.	#F.D.	#F ₁ plant	Embryo Survival (%)	Embryoes#/ Florets# (%)
<i>H. strumosus</i> (PI547217) × HA410	202		2	4	51	57	28.22	8.66
<i>H. strumosus</i> (PI547226) × HA410	633			7	63	70	11.06	11.11
<i>H. tuberosus</i> (PI547242) × HA410	271		1	1	14	16	5.90	9.34
<i>H. tuberosus</i> (PI650089) × HA410	2642			23	71	94	3.56	18.42
<i>H. tuberosus</i> (PI650105) × HA410	720	1	1	23	44	69	9.58	11.14
<i>H. decapetalus</i> (PI435880) × HA410	1090		24	93	16	133	12.20	7.50
Total	5558	1	28	151	259	439		

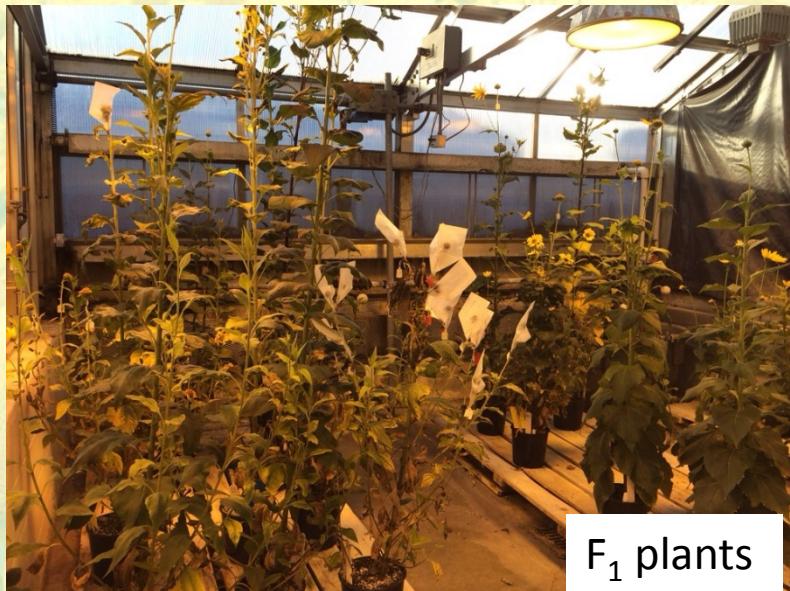

Results

BC ₁ F ₁ seeds set in interspecific crosses		
Parentage	BC ₁ F ₁ Seeds No.	BC ₁ F ₁ Seeds set %
<i>H. strumosus</i> (PI547217) × HA410	239	12.35
<i>H. strumosus</i> (PI547226) × HA410	377	8.13
<i>H. tuberosus</i> (PI547242) × HA410	173	21.93
<i>H. tuberosus</i> (PI650089) × HA410	2217	19.40
<i>H. tuberosus</i> (PI650105) × HA410	1309	16.56
<i>H. decapetalus</i> (PI435880) × HA410	0	0
