Current Problems

- Phomopsis stem canker continues to be of concern in 2015.
 - Disease incidence was between 40 to 100% in commercial fields (H. Kandel and T. Gulya, 2015 NSA survey).

Picture by Dr. Sam Markell

Current Problems

- Limited management options
- Most commercial hybrids are susceptible to Phomopsis stem canker.
 - Yield reduction is similar for both hybrids (Mathew et al. 2015).

Current Problems

- Previous research
 - In 2014, fungicides were investigated in North Dakota and Nebraska (S. Markell and R. Harveson, *unpublished*).
 - Results showed fungicides alone may be inadequate.

In 2015

Objective:

Evaluate an integrated approach to manage Phomopsis stem canker.

Materials and methods:

- A total of eight locations established in SD, MN and NE
- Susceptible and tolerant hybrids solicited from companies
- Fungicide applications at growth stages (V12-R1, R1-R3, R3-R5).
- Disease was evaluated at R5 or later (after flowering).
- Data analyses performed in SAS v9.3.

Onida, SD; Cooperator - Mr. Tom Young (Mycogen seeds)

■ Susceptible ■ Resistant

(LSD = 532.99; $P < 0.0001^*$)

Yield (lb/A)

South Dakota State University®

- Onida, SD.
- Priaxor @ 4 fl oz/A (Fluxapyroxad + Pyraclostrobin, BASF)
- Mycogen hybrids.

Summary

- Symptoms of Phomopsis stem canker observed after flowering
- Choosing a resistant over susceptible hybrid
 - Yield increase \geq 400 lbs/A
- Fungicide
 - What to spray?
 - Strobilurin fungicides (=FRAC Group 11) offer control (Gilley et al. 2015)

South Dakota State University®

Summary

- Results in 2015 suggest
 - On a susceptible/resistant hybrid
 - Fungicide applications at R1-R3 may be considered
- We hope to repeat the study in 2016 (*Pending funding*)
